Tutorial Goals

Familiarize Members of:

- *Safety* and *Security* Teams with:
 - Foundations of *Requirements Engineering*
 - *Common Concepts and Techniques from Both Disciplines*
- *Requirements* Teams with the Foundations of:
 - *Safety Engineering*
 - *Security Engineering*

Familiarize Members of all three Disciplines with:

- Different Types of *Safety- and Security-related Requirements*
- Common *Process* for Engineering these Requirements

Safety and Security Engineering

Safety Engineering

the engineering discipline within systems engineering concerned with lowering the risk of *unintentional unauthorized* harm to valuable assets to a level that is acceptable to the system's stakeholders by preventing, detecting, and reacting to such harm, mishaps (i.e., accidents and incidents), hazards, and safety risks

Security Engineering

the engineering discipline within systems engineering concerned with lowering the risk of *intentional unauthorized* harm to valuable assets to a level that is acceptable to the system's stakeholders by preventing, detecting, and reacting to such harm, misuses (i.e., attacks and incidents), threats, and security risks

Differences:

- Unintentional vs. Intentional
- Accidental vs. Malicious Harm
- Mishaps vs. Misuses
- Hazards vs. Threats

 **Software Engineering Institute** | Carnegie Mellon

Challenges₁

Requirements Engineering, Safety Engineering, and Security Engineering:

- Different *Communities*
- Different *Disciplines* with different Training, Books, Journals, and Conferences
- Different *Professions* with different Job Titles
- Different fundamental underlying *Concepts* and Terminologies
- Different *Tasks, Techniques, and Tools*

Safety and Security Engineering are:

- Typically treated as secondary Specialty Engineering Disciplines
- Performed separately from, largely independently of, and lagging behind the primary Engineering Workflow (Requirements, Architecture, Design, Implementation, Integration, Testing)

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 10

Challenges₂

Current separate Processes for Requirements, Safety, and Security are Inefficient and Ineffective.

Separation of Requirements Engineering, Safety Engineering, and Security Engineering:

- Causes *poor* Safety- and Security-related Requirements.
 - Goals rather than Requirements
 - Vague, unverifiable, unfeasible, architectural and design constraints
- Inadequate and too late to drive architecture and testing
- Difficult to achieve Certification and Accreditation

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 11

Challenges₃

Poor requirements are a primary cause of more than half of all project failures (defined in terms of):

- Major Cost Overruns
- Major Schedule Overruns
- Major Functionality not delivered
- Cancelled Projects
- Delivered Systems that are never used

Poor Requirements are a major Root Cause of many (or most) Accidents involving Software-Intensive Systems.

Security 'Requirements' often mandated:

- Industry Best Practices
- Security Functions or Subfunctions

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 12

Challenges₄

How Safe and Secure is Safe and Secure *enough*?

Situation Cries out for Process Improvement:

- Better Consistency between Safety and Security Engineering
 - More consistent Concepts and Terminology
 - Reuse of Techniques across Disciplines
 - Less Unnecessary Overlap and Avoidance of Redundant Work
- Better Collaboration:
 - Between Safety and Security Engineering
 - With Requirements Engineering
- Better Safety- and Security-related Requirements

15

Desired Characteristics

Common Ongoing Example throughout the Tutorial

Should Not Need Special Domain Knowledge

Example System should be:

- Safety-Critical
- Realistic
- SW-Intensive
- Understandable in terms of:
 - Goals and Requirements
 - Application Domain Technology
 - Safety Hazards and Security Threats
 - Accidents and Attacks

Requirements Engineering

Definition

the engineering discipline within systems/software engineering concerned with identifying, analyzing, reusing, specifying, managing, verifying, and validating goals and requirements (including safety- and security-related requirements)

the cohesive collection of all *tasks* that are primarily performed to produce the *requirements* and *other related requirements work products* for an *endeavor*

Today, these RE tasks are typically performed in an *iterative, incremental, parallel, and time-boxed* manner rather than according to the traditional Waterfall development cycle, whereby:

- Incremental means:
 - Recursively incremental from subsystem to subsystem
 - Incrementally scheduled from block/milestone to block/milestone
- Parallel means concurrently with the:
 - Primary work flow disciplines such as architecting, design, and testing
 - Specialty engineering disciplines such as safety and security engineering

Importance and Difficulty of Requirements Eng.

Poor requirements are a primary cause of more than half of all:

- Project failures (defined in terms of):
 - Major cost overruns
 - Major schedule overruns
 - Major functionality not delivered
 - Cancelled projects
 - Delivered systems that are never used
- Hazards and associated Mishaps (Accidents and Safety Incidents)
- Vulnerabilities

The extent of the impact of poor requirements on threats and associated misuses (Attacks and Security Incidents) is much less clear.

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 35

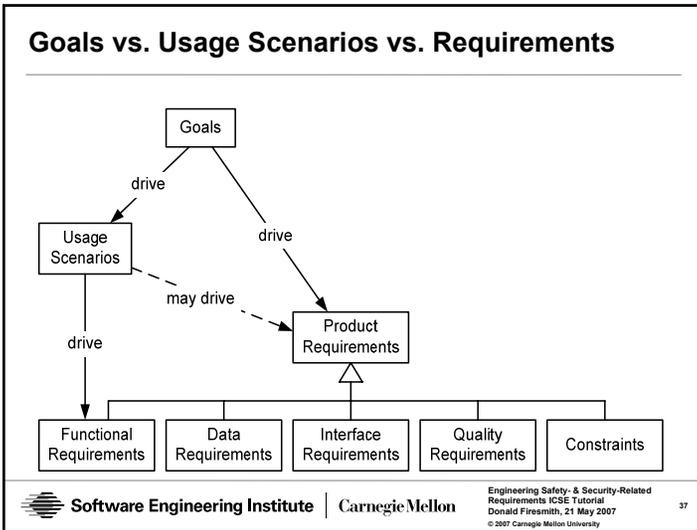

Difficulty of Requirements Engineering

“The hardest single part of building a software system is deciding precisely what to build. No other part of the conceptual work is as difficult as establishing the detailed technical requirements, including all the interfaces to people, to machines, and to other software systems. No other part of the work so cripples the resulting system if done wrong. No other part is more difficult to rectify later.”

F. Brooks, *No Silver Bullet*, IEEE Computer, 1987

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 36

Goals

A **goal** is an *informally documented perceived need of a legitimate stakeholder*.

Goals are:

- *Not* requirements.
- Drive the analysis and formal specification of the requirements.
- Typically ambiguous and/or unrealistic (i.e. impossible to guarantee).

A *major* problem is safety and security goals that are specified as if they were unambiguous, 100% feasible, verifiable requirements.

Goals are typically documented in a vision statement.

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 38

Example ZATS Goals

Functional Goals:

- ZATS must rapidly transport patrons between the parking lots and the zoo.
- ZATS must rapidly transport patrons between habitats within the zoo.
- ZATS must allow patrons to take leisurely tours of the habitats.

Data Goal:

- ZATS must record and report appropriate system usage statistics.

Capacity Goal:

- ZATS must include sufficient taxis so that patrons need not wait long for a free taxi.

Usability Goal:

- ZATS must be very easy and intuitive for patrons to use, including those who are not very good with technology.

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 39

Example ZATS Defensibility Goals

Safety Goals:

- "ZATS taxis must be safe."
- "ZATS must not have any serious accidents."
- "ZATS taxis must never collide."
- "ZATS will never kill or injure its passengers or maintainers."

Security Goals:

- "Passenger credit card data must be secure."
- "ZATS taxi service must be protected from denial of service attacks."
- "ZATS computers must prevent infection by malware."
- "ZATS facilities must be protected against arson."
- "ZATS must restrict users to only those tasks for which they are authorized."

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial

© 2007 Carnegie Mellon University 40

Usage Scenarios

A **usage scenario** is a specific functionally cohesive sequence of interactions between user(s), the system, and potentially other actors that provides value to a stakeholder.

Usage scenarios:

- Are instances of use cases.
- Can be either “sunny day” or “rainy day” scenarios.
- Have preconditions, triggers, and postconditions.
- Are typically documented in an Operational Concept Document (OCD).
- Drive the analysis and formal specification of the [primarily functional] requirements.
- Often include potential design information.
- Can be written in either list or paragraph form.

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University 41

Example ZATS Scenario

Ride Zoo Loop Line To Restaurants for Lunch:

After the family enters a waiting taxi, Mr. Smith looks at the zoo map on its ceiling. A light representing their taxi is glowing at the Tropical Rainforest Habitat outer taxi station. He uses the control panel to select the inner taxi station at the habitat, which is the central taxi station near the restaurants and shops as a destination. He then swipes his zoo taxi debit card, and the display shows the remaining balance of \$9.00 on the card. The taxi warns them to set down and thirty seconds later, the station and taxi exit doors close. Their taxi accelerates out of the taxi station and turns to the left onto the Zoo Loop Line.

Shortly after leaving the taxi station, they see a spur the angles off to their left towards a large building containing the taxi control center and maintenance facility. They continue around the outside of the zoo, passing other the Great Cats, the Wolves and Other Dogs, and the Bears habitats. Just before they reach the outer African Savanna taxi station, the guideway makes a sweeping turn to the right and they can see the parking lot on their left. Everyone looks to see if they can see the family van, but the parking lot is too big and they can only see the parking lot taxi station near where it is parked.

Soon, they pass the zoo entrance on their left and turn right to follow the main street to where the main restaurants and shops are. Their taxi passes the inner African Savanna taxi station on their right, circles around the central area, and soon pulls off the Zoo Loop Line to enter the inner Great Apes and Monkeys taxi station. Exiting the taxi when the doors open, they head down the elevator and outside for an early lunch at one of the many restaurants.

Requirements

A (product) **requirement** is a *mandatory* characteristic (behavior or attribute) of a product (e.g., system, subsystem, software application, or component).

- Requirements are documented in requirements specifications.
- Requirements are driven by goals.
- Example:
 “At each taxi station while under normal operating conditions, ZATS shall provide a taxi to passengers within an average of 5 minutes of the passengers’ request.”
- Requirements must have certain characteristics (e.g., verifiable and feasible).

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University 43

Characteristics of Good Requirements

Mandatory	Complete
Correct	Consistent
Cohesive	Usable by Stakeholders
Feasible	Uniquely Identified
Relevant	Traced
Unique	Externally Observable
Unambiguous	Stakeholder-Centric
Validatable	Properly Specified
Verifiable	Prioritized
What or How Well, not How	Scheduled
	Managed
	Controlled

 © 2007 Carnegie Mellon University 44

Some Problems due to Poor Requirements

Ambiguous Requirements:

- Developers misinterpret Subject Matter Expert (SME) intentions.
- "The system shall be safe."
- How safe? Safe in what way?

Incomplete Requirements:

- Developers must guess SME intentions.
- "The system shall do X."
- Under what conditions? When in what state? When triggered by what event? How often? How fast? For whom? With what result?

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 45

More Potential Problems

Missing Requirements:

- What shall the system do if it can't do X?
- Unusual combinations of conditions often result in accidents.
- What shall the system do if event X occurs when the system is simultaneously in states Y and Z?

Unnecessary Constraints:

- Inappropriate architecture and design constraints unnecessarily specified as requirements such as:
 - User ID and password for identification and authentication.

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 46

Poor Requirements Cause Accidents₁

"The majority of software-related accidents are caused by requirements errors."

"Software-related accidents are usually caused by flawed requirements. Incomplete or wrong assumptions about the operation of the controlled system can cause software related accidents, as can incomplete or wrong assumptions about the required operation of the computer. Frequently, omitted requirements leave unhandled controlled-system states and environmental conditions."

Nancy G. Leveson, 2003

<http://www.safeware-eng.com/index.php/white-papers/accidents>

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 47

Poor Requirements Cause Accidents₂

Large percentage of accidents are caused by poor requirements:

- "For the 34 (safety) incidents analyzed, 44% had inadequate specification as their primary cause."

Health and Safety Executive (HSE), *Out of Control: Why Control Systems Go Wrong and How to Prevent Failure* (2nd Edition), 1995

- "Almost all accidents related to software components in the past 20 years can be traced to flaws in the requirements specifications, such as unhandled cases."

Safeware Engineering, "Safety-Critical Requirements Specification and Analysis using SpecTRM", 2002

 **Software Engineering Institute** | Carnegie Mellon

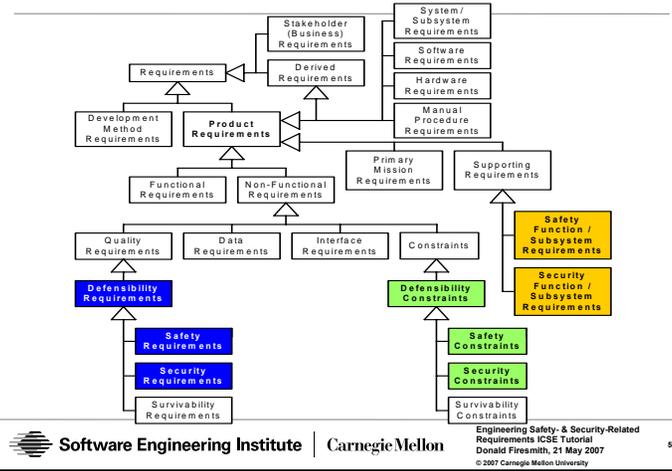

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 48

Poor Requirements Cause Accidents₃

Erroneous specification is a major source of defects and subsequent failure of safety-critical systems. Many failures occur in systems using software that is perfect, it is just not the software that is needed because the specification is defective.”

John C. McKnight, “Software Challenges in Aviation Systems, 2002

Types of Requirements

Product Requirements

A **product requirement** is a requirement for a *product* (e.g., system, subsystem, software application, or component).

- A **functional requirement** is a product requirement that specifies a mandatory *function* (i.e., behavior) of the product.
- A **data requirement** is a product requirement that specifies mandatory [types of] data that must be manipulated by the product.
- An **interface requirement** is a product requirement that specifies a mandatory interface with (or within) the product.
- A **quality requirement** is a product requirement that specifies a mandatory amount of a type of product quality.
- A **constraint** is a property of the product (e.g., design decision) that is ordinarily not a requirement but which is being mandated as if it were a normal requirement

Representative ZATS Functional Requirement

Prepare for departure warning:

- When a taxi is in the IN SERVICE – STOPPED AT STATION state and its passengers have selected a tour of a habitat and paid for the tour, then (1) ZATS *shall* warn the passengers in the taxi and in the taxi station in front of the taxi (a) to stop boarding that particular taxi because the doors will soon close and (b) to stay away from the doors and (2) ZATS shall transition the taxi to the IN SERVICE – PREPARE FOR DEPARTURE state.

Note precondition, trigger, required behavior, and postcondition.

Representative ZATS Data Requirement

ZATS shall record the following information about each trip:

- Taxi Identifier
- Taxi Travel Card:
 - Identifier
 - Debit Amount
 - Remaining Balance
- Starting Station
- Destination Station
- Departure Time
- Arrival Time

 **Software Engineering Institute** | Carnegie Mellon

 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University

53

Representative ZATS Interface Requirements

ZATS shall interface with the emergency responder systems (e.g., 911) to enable the:

- Operator to request emergency services
- Emergency responders to view ZATS status

ZATS shall interface with the Bank Card Processing Gateway in order to request bank card approval to pay for zoo taxi travel cards.

ZATS shall interface with the Zoo Information System to obtain employee and zoo membership information.

 **Software Engineering Institute** | Carnegie Mellon

 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University

54

Representative ZATS Constraints

Architecture Constraints:

- ZATS shall use pre-stressed reinforced concrete guideways able to support 150% max. expected loading.
- ZATS guideways shall be elevated to provide good visibility, to separate patrons from the animals, and to eliminate the possibility of collision between taxis and patrons' vehicles in the parking lots.
- ZATS shall use COTS electric motors.
- ZATS taxis shall use standard automobile tires.
- ZATS shall use a commercial real-time operating system.

Design Constraints:

- ZATS software shall be object-oriented.

Implementation Constraints:

- ZATS software shall be programmed in a safe subset of C++.

 **Software Engineering Institute** | Carnegie Mellon

 Engineering Safety- & Security-Related Requirements ICSE Tutorial

55

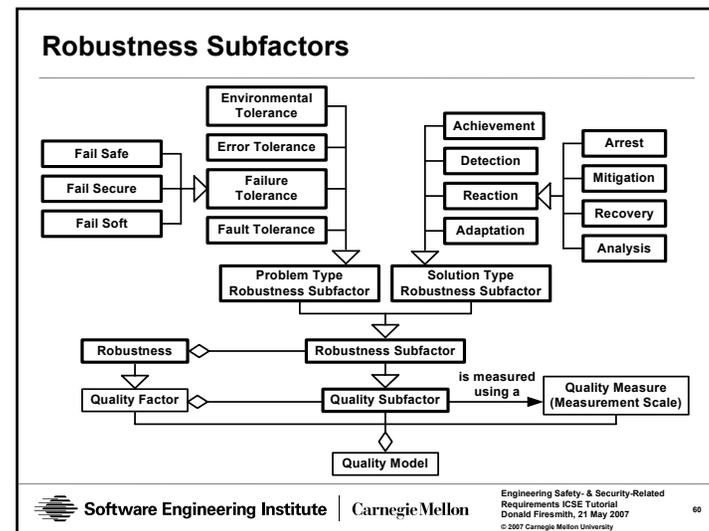

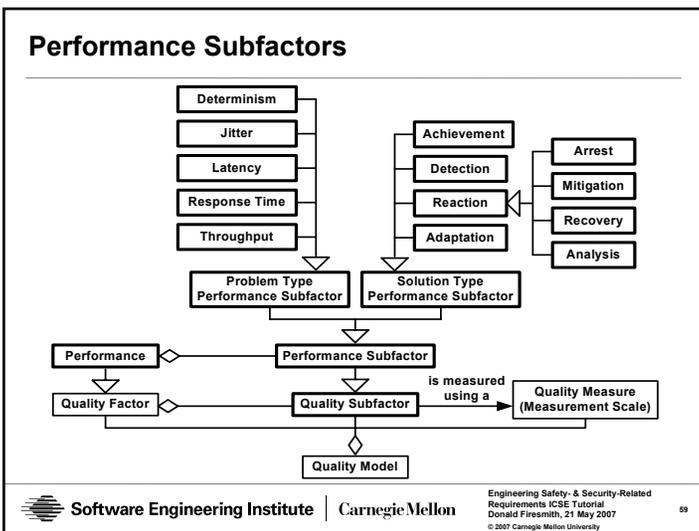

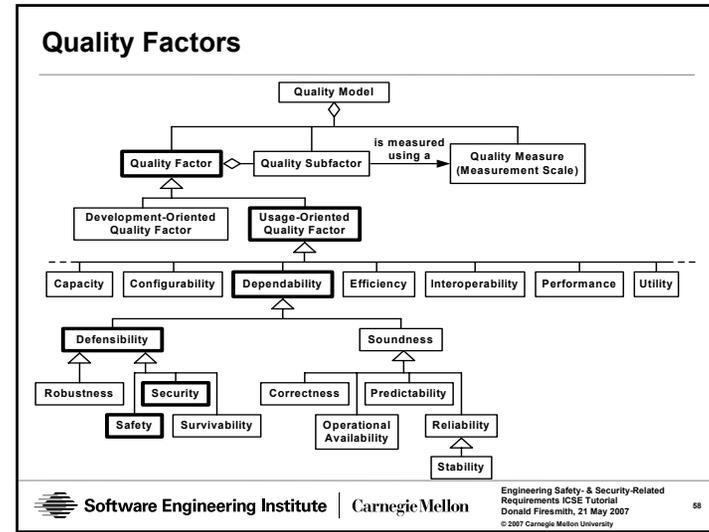

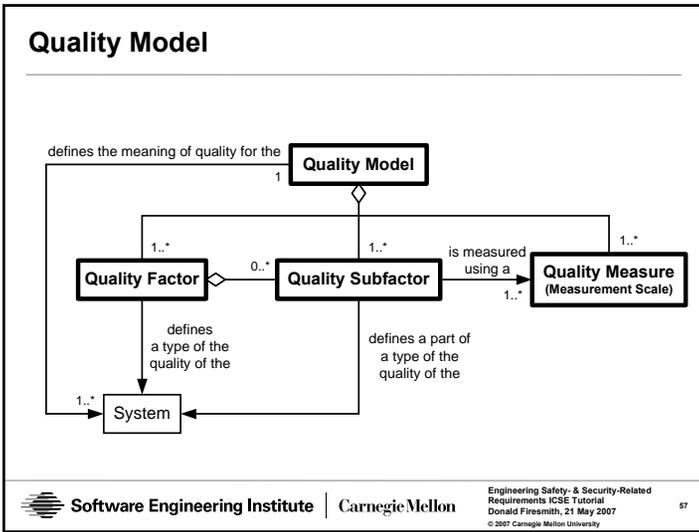

Quality Requirements:

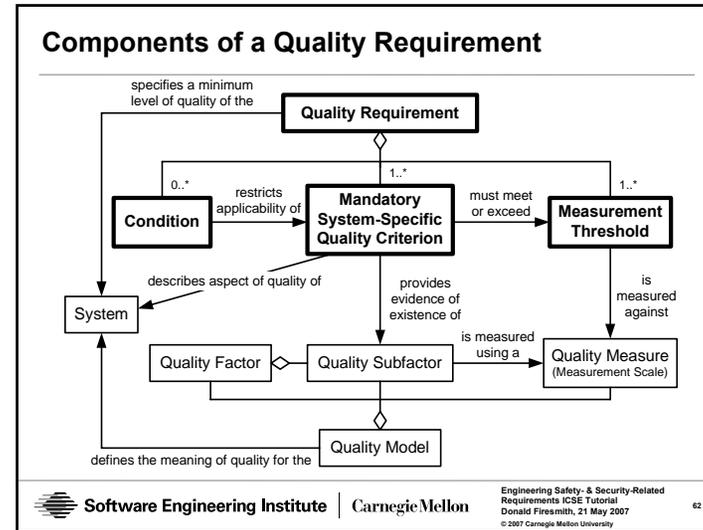

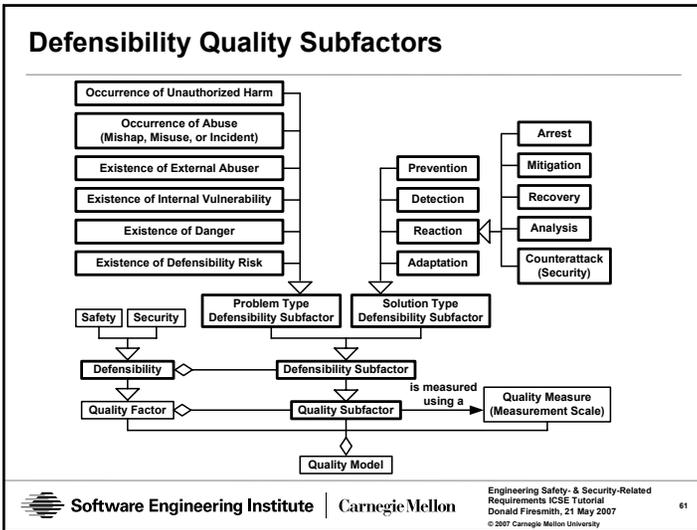

Specify Minimum Acceptable Quality

 **Software Engineering Institute** | Carnegie Mellon

 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University

56

Example Quality Requirement

Hazard Prevention Safety Requirement:
"Under normal operating conditions, a taxi shall not move when it's doors are open more than an average of once every 10,000 trips."

Component Parts:

- **Condition:**
"Under normal operating conditions"
(e.g., neither during maintenance nor a fire in a taxi station)
- **Mandatory System-Specific Quality Criterion:**
"a taxi shall not *move* when it's doors are *open*"
(The meaning of moving and open must be unambiguously defined.)
- **Measurement Threshold:**
"more than an average of once every 10,000 *trips*."
(A trip is defined as intentional travel from a station where passengers enter the taxi to the station where the passengers exit the taxi.)

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 63

Importance of Measurement Threshold

Measurement Threshold is:

- Critical
- Difficult (but not impossible) to determine
- Often left out of quality requirements
- Needed to avoid ambiguity

States how much quality is necessary (adequate)

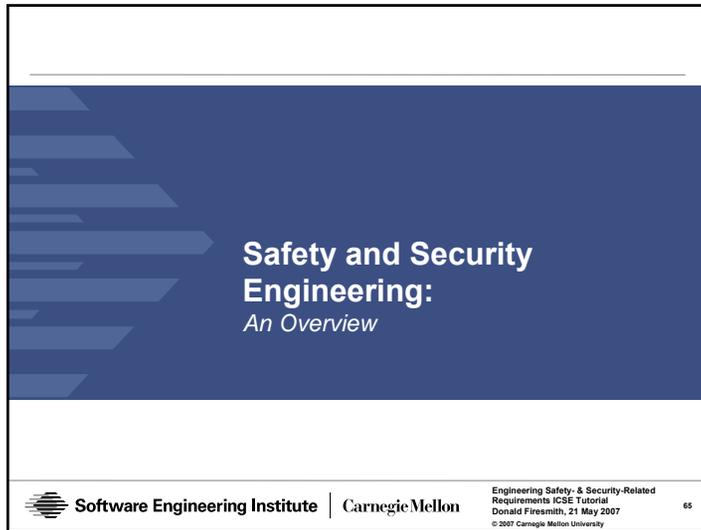

Enables architect to:

- Determine if architecture is adequate
- Make engineering trade-offs between competing quality factors

Enables tester to determine test completion criteria

Categories of Asset Values

The values of assets are used to determine how to invest limited resources in protecting them from accidental harm.

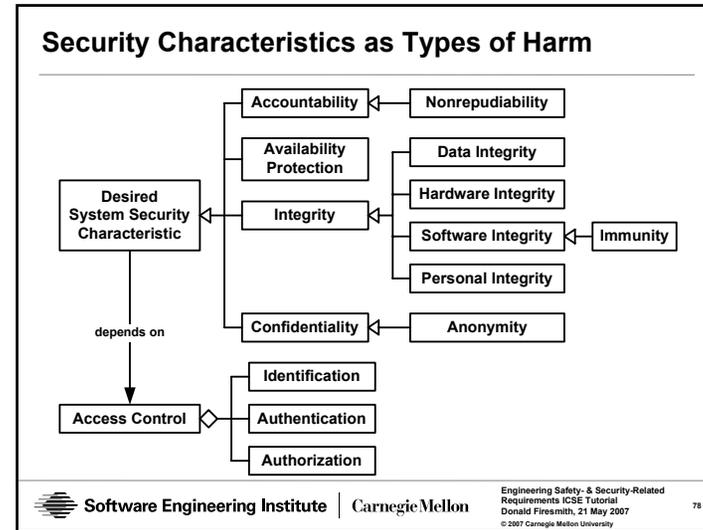

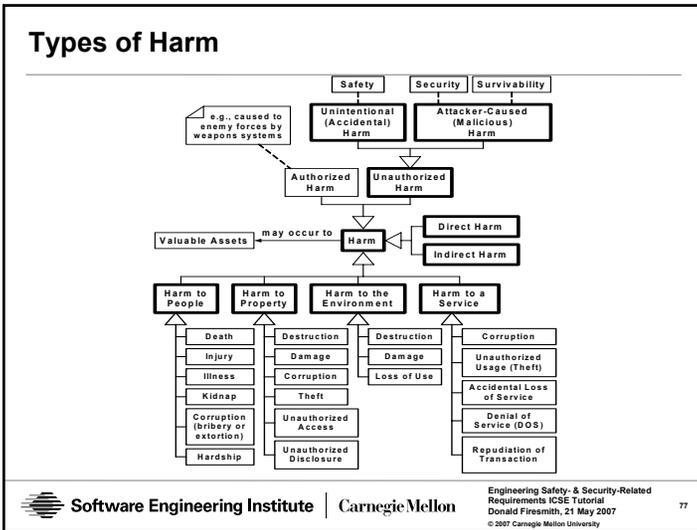

Sometimes, all values are measured in terms of money in order to be able to compare "apples and oranges."

More often, the asset values are categorized:

- Extremely valuable (i.e., invaluable or priceless)
- Major
- Moderate
- Minor
- Negligible (i.e., not worth considering)

When used, categories should be well defined (e.g., unambiguous)

Software Engineering Institute | Carnegie Mellon | Engineering Safety- & Security-Related Requirements ICSE Tutorial Donald Firesmith, 21 May 2007 © 2007 Carnegie Mellon University 76

Harm Severity

Harm severity is an appropriate categorization of the amount of harm.

Harm severity categories can be standardized (ISO, military, industry-wide) or endeavor-specific.

Harm severity categories need to be:

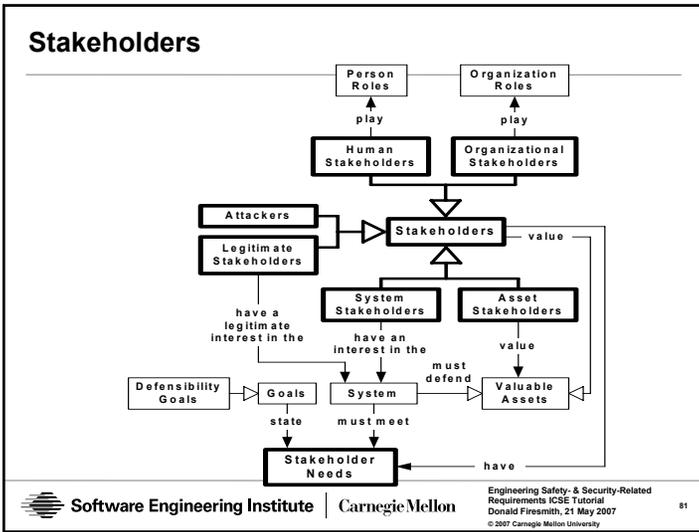

- Clearly identified.
- Appropriately and unambiguously defined.

Note that some standards confuse harm severity with hazard “severity” (i.e., categorization of hazard based on the severity of harm that its accidents can cause)

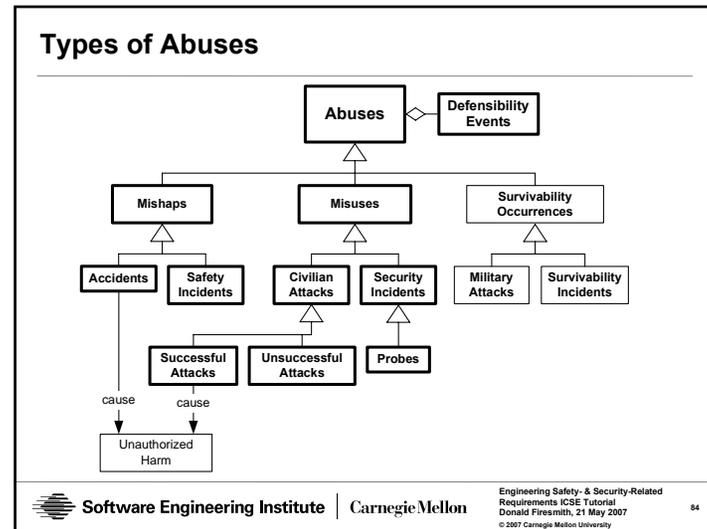

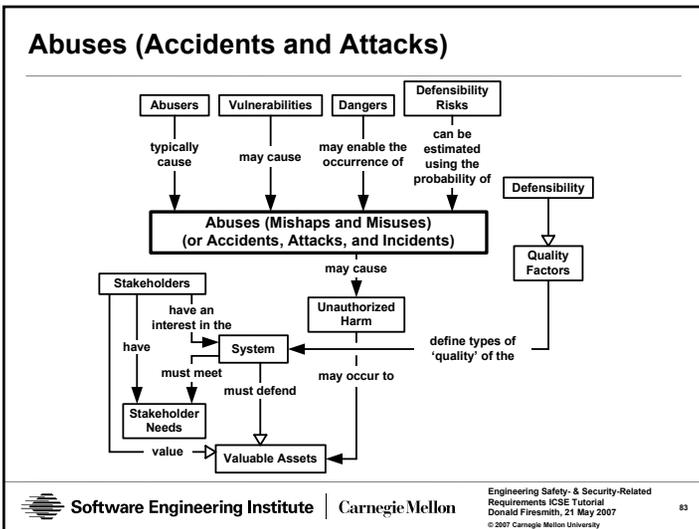

Example Harm Severity Categories

The International Electrotechnical Commission (IEC) standard, *Medical Electrical Equipment - Part 1: General Requirements for Safety* (IE 601-1-4: 1996), defines harm severity levels as follows:

- **Catastrophic:**
 - Potential of multiple deaths or serious injuries
- **Critical:**
 - Potential of death or serious injury
- **Marginal:**
 - Potential of injury
- **Negligible:**
 - Little or no potential of injury

- ### Some ZATS Stakeholders
- People:
- Emergency Responders
 - Passengers
 - Operators
 - Maintainers
 - ZATS Developers
 - Zoo Employees
 - Zoo Management
- Organizations:
- Bank Card Processing Gateway
 - Safety and Security Certification/Accreditation Bodies
 - Zoo Regulatory Bodies
- Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial

Importance of Accidents

Accidents can have expensive and potentially fatal repercussions:

- Ariane 5 Maiden Launch
 - Reuse of Ariane 4 software not matching Ariane 5 specification
- Mars Climate Orbiter (\$125 million)
 - English vs. Metric units mismatch
- Mars Polar Lander
 - Missing requirement concerning touchdown sensor behavior
- Therac-25 Radiation Therapy Machine
 - Timing of unusual input sequence results in unexpected output
- Patriot Missile Battery Misses SCUD
 - Missing availability (uptime) requirement

Example ZATS Abuses (Mishaps and Misuses)

Accidents:

- Natural Disasters
- Taxi Accidents
- Taxi Station Accidents

Safety Incidents:

- Inadequate Headway
- Overspeed

Attacks:

- Arson
- Cyber-attacks

Security Incidents:

- Antivirus Software Works

Abuse Likelihood Categories

Abuse Likelihood Categorization is an appropriate categorization of the probability that an abuse occurs.

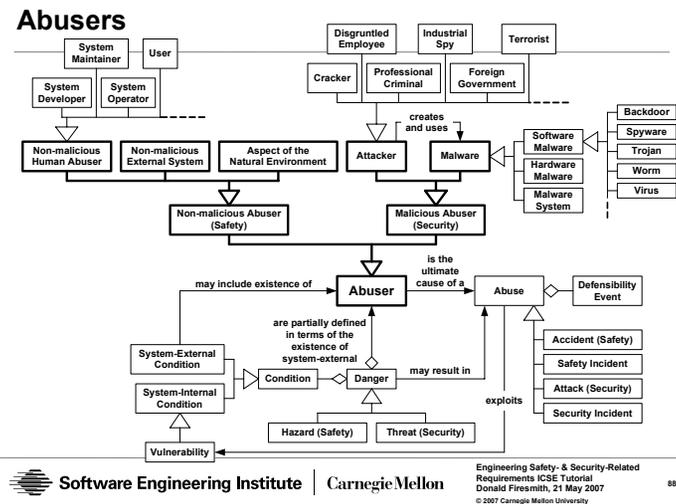

Abuse Likelihood Categories:

- Can be standardized (ISO, military, industry-wide) or endeavor-specific.
- Need to be identified and defined.

Example Abuse Likelihood Categories include:

- Frequent
- Probable
- Occasional
- Remote
- Implausible

Abuse Likelihood Categories need to be carefully and unambiguously defined.

Example ZATS Abusers

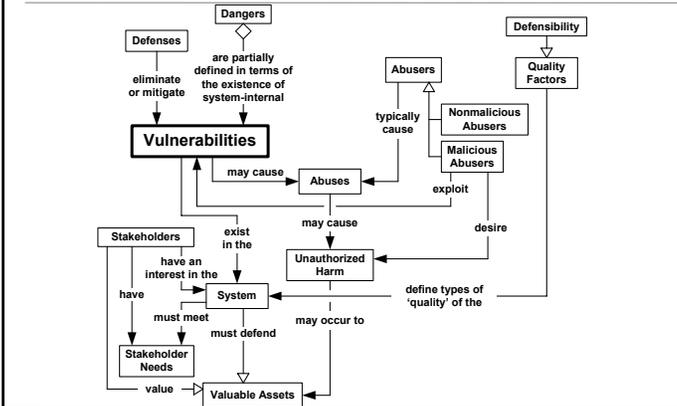

Non-Malicious Abuser:

- Human Abuser (e.g., Developer, Maintainer, Operator, Passenger)
- External Systems (e.g., Communications Network, Electrical Power Grid)
- Natural Environment (e.g., River or Weather)

Malicious Abuser:

- Attackers (e.g., Arsonists, Crackers, Terrorists, Thieves)
- Malware (e.g., virus, Trojan horse, Worm)

Vulnerabilities

Vulnerabilities

A **vulnerability** is a potential or actual *system-internal weakness* (defect) in the architecture, design, implementation, integration, or deployment of a system that enables:

- A danger (hazard or threat) to exist.
- A safety or security incident to occur.
- An accident or attack to occur.

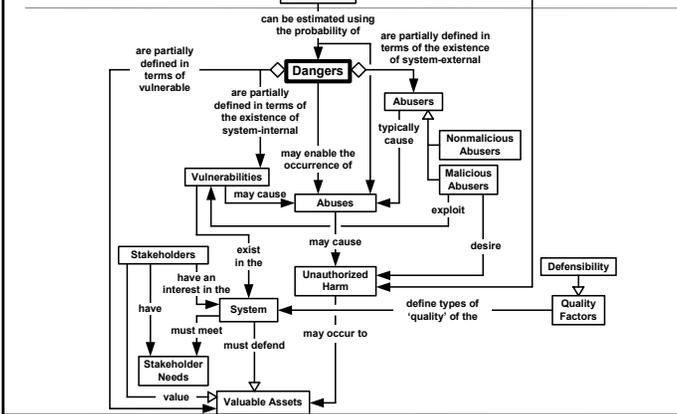

Only relevant to requirements if a requirement needs to be specified to prevent the vulnerability or mitigate its negative consequences.

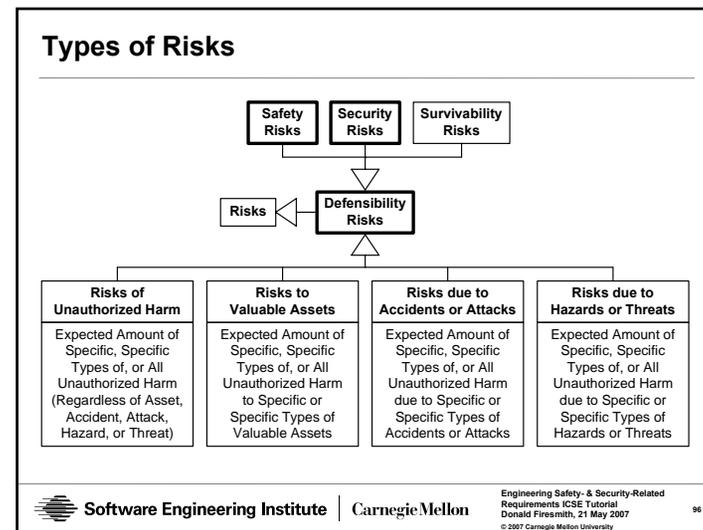

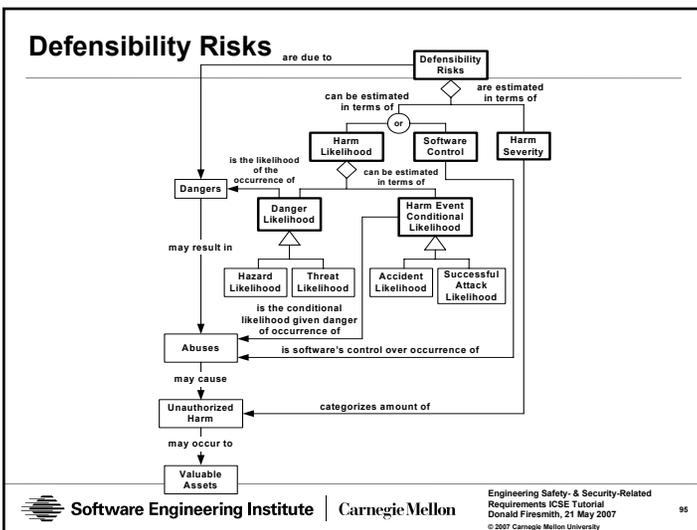

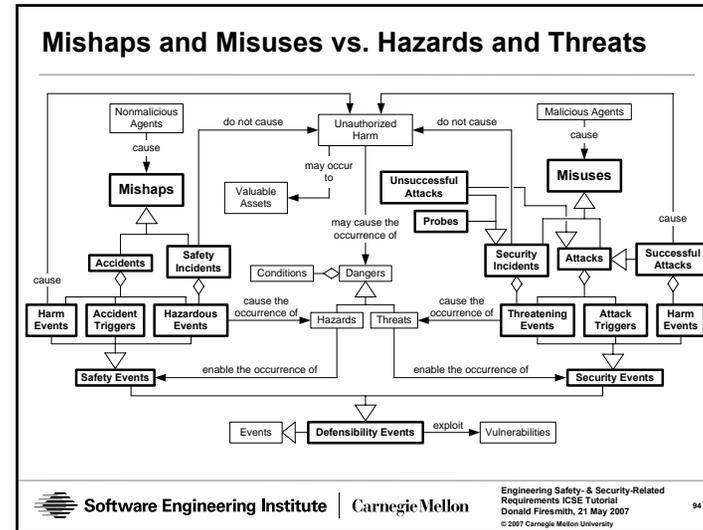

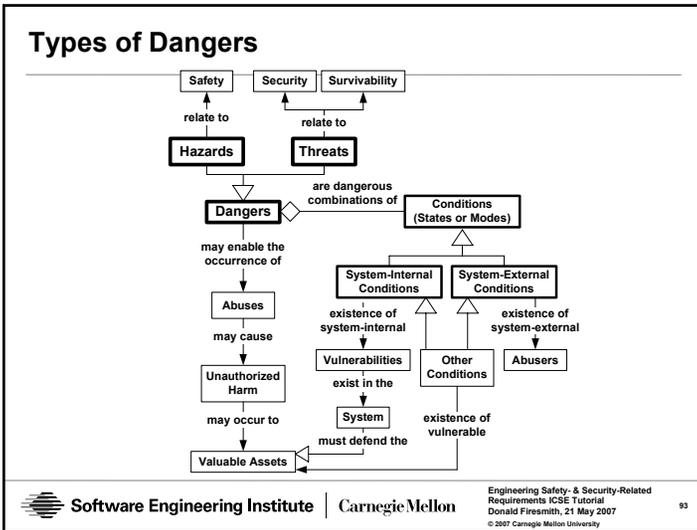

For example, if taxi doors do not have locks or lock sensors.

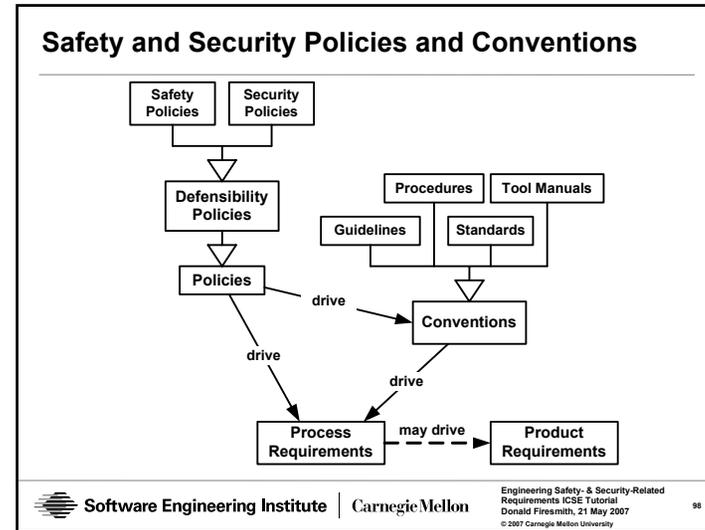

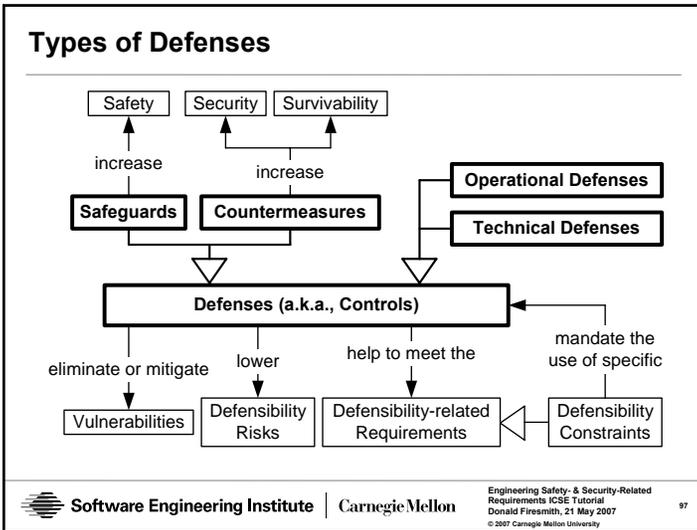

Ways to Identify Vulnerabilities include:

- Analyze Historical Data
- Identify Hardware or Software Defects
- Consider Hardware or Software Failures that can cause Vulnerabilities.

Dangers

Safety and Security Policies

Policy – a strategic *process* decision that establishes a desired goal.

Safety Policy – a policy that enables the achievement of one or more *safety goals*:

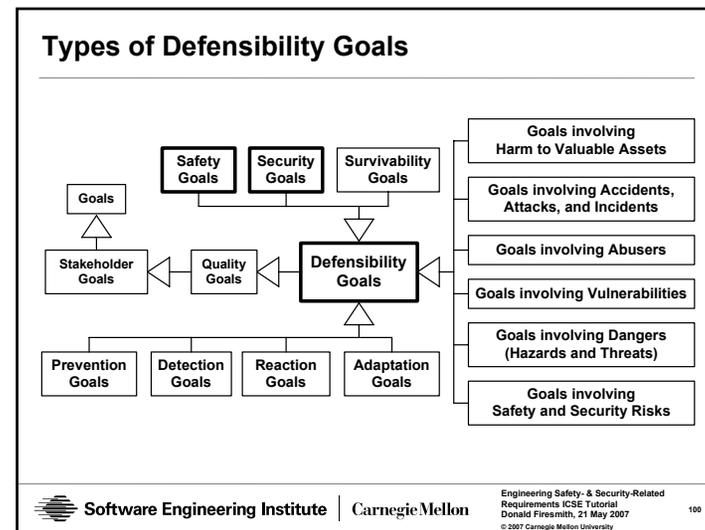

- “The overall responsibility for safety must be identified and communicated to all stakeholders.”
- “A hazard analysis shall be performed during early in the project.”
- “All users will have safety training.”

Policies are typically collected into Safety or Security Policy Documents.

In practice, policies are confused with requirements, and conversely policy documents may sometimes include requirements.

Why can this cause problems?

Types of Safety- and Security-Related Requirements

Too often only a Single Type of Requirements is considered.

Not just:

- Special Non-Functional Requirements (NFRs):
 - Safety and Security Requirements are Quality Requirements are NFRs
- Safety- and Security-Significant Functional, Data, and Interface Requirements
- Constraints on Functional Requirements
- Architecture and Design Constraints
- Safety and Security Functions/Subsystems
- Software Requirements

Reason for Presentation Title

Safety- and Security-Related Requirements for Software-Intensive Systems

Safety and Security Requirements

Safety and Security Requirements are *Quality* Requirements.

Quality Requirements are Product Requirements that specify a mandatory amount of a type of product quality (i.e., quality factor or quality subfactor).

Quality Requirements should be:

- Scalar (How Well or How Much)
- Based on a Quality Model
- Specified in Requirements Specifications
- Critically Important Drivers of the Architecture

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 106

Example Safety Requirement Templates

“When in mode V, the system shall not cause *accidental harm* of type W to valuable assets of type X at an average rate of more than Y asset value per Z time duration.”

“When in mode W, the system shall not cause *mishaps* of type X with an average rate of more than Y mishaps per Z trips.”

“When in mode X, the system shall not cause *hazard* Y to exist more than an average of Z percent of the time.”

“When in mode X, the system shall not have a *safety risk level* of X.”

“When in mode X, the system shall *detect accidents* of type Y an average of at least Z percent of the time.”

“Upon detecting an accident of type Y when in mode X, the system shall *react* by performing functions Y an average of at least Z percent of the time.”

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 107

Example Security Requirement Templates

“When in mode V, the system shall not limit the occurrence of *malicious harm* of type W to valuable assets of type X to an average rate of less than Y asset value per Z time duration.”

“When in mode W, the system shall not prevent *successful attacks* of type X to an average rate of less than Y attacks per Z time duration.”

“When in mode X, the system shall prevent *hazard* Y from existing for more than an average of Z percent of the time.”

“When in mode X, the system shall not have a *security risk level* of X.”

“When in mode X, the system shall *detect misuses* of type Y an average of at least Z percent of the time.”

“Upon detecting a misuse of type Y when in mode X, the system shall *react* by performing functions Y an average of at least Z percent of the time.”

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 108

Safety- and Security-Significant Requirements

Are identified based on Safety or Security (e.g., hazard or threat) Analysis

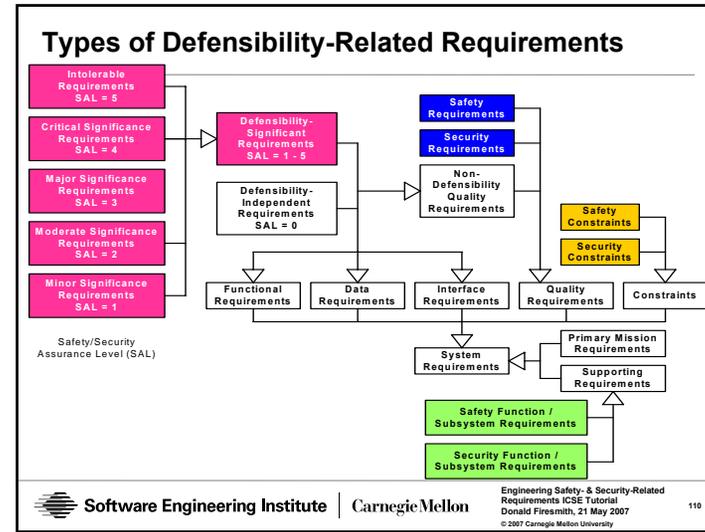

Subset of non-Safety and non-Security Requirements:

- Functional Requirements
- Data Requirements
- Interface Requirements
- Other Quality Requirements
- Constraints

Safety/Security Assurance Level (SAL) is not 0:

- May have minor Safety/Security Ramifications
- May be Safety- or Security-Critical
- May have intolerable Safety or Security Risk

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007 © 2007 Carnegie Mellon University 109

SALs and SEALs

Safety/Security Assurance Level (SAL)

a category of required safety or security for safety- or security-significant requirements.

Safety/Security Evidence Assurance Level (SEAL)

a category of required evidence needed to assure stakeholders (e.g., safety or security certifiers) that the system is sufficiently safe or security (i.e., that it has achieved its required SAL).

SALs are for *requirements*

SEALs are for *components* that collaborate to fulfill requirements (e.g., *architecture*, design, coding, testing)

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007 © 2007 Carnegie Mellon University 111

Safety-Significant Requirements (cont)

Require enhanced Safety/Security Evidence Assurance Levels (SEALs) including more rigorous development process (including better requirements engineering):

- Formal Specification of Requirements
- Fagan Inspections of Requirements

Too often SEALs only apply to design, coding, and testing:

- Safe Subset of Programming Language
- Design Inspections
- Extra Testing

Architecture and Training (process) also important

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007 © 2007 Carnegie Mellon University 112

Example Safety-Significant Requirements

ZATS Safety-Significant Requirements:

- Controlling Doors (Opening, Closing, Locking)
- Accelerating and Decelerating (Power Braking System)
- Merging Traffic

Firing Missiles from Military Aircraft Requirements:

- When to Arm Missiles
- Controlling Doors before and after firing missiles
- Detecting Weight-On-Wheels

Chemical Plant Requirements:

- Mixing and Heating Chemicals
- Controlling Exothermic Reactions
- Detecting Temperature and Pressure

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 113

Example ZATS Security-Significant Requirements

Access Control Requirements:

- Identification, Authorization, and Authorization

Integrity:

- Storage and Transmission of Sensitive Data
- Software that might get Infected by Malware
- Software that might represent Intellectual Property

Confidentiality

- Handling of Sensitive Information

Availability (under attack):

- Services Subject to Denial-of-Services Attacks

Non-repudiation:

- Transactions

Safety and Security Function/Subsystem Rqmts.

Defensibility Function/Subsystem Requirements are requirements for functions or subfunctions that exist strictly to improve defensibility (as opposed to support the primary mission requirements).

- **Safety Function/Subsystem Requirements** are requirements for safety functions or subsystems.
- **Security Function/Subsystem Requirements** are requirements for security functions or subsystems.

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 115

Example Safety Function/Subsystem Rqmts.

Functions or subsystems strictly added for safety:

- Aircraft Safety Subsystems:
 - Collision Avoidance System
 - Engine Fire Detection and Suppression
 - Ground Proximity Warning System (GPWS)
 - Minimum Safe Altitude Warning (MSAW)
 - Wind Shear Alert
- Nuclear Power Plant:
 - Emergency Core Coolant System

All requirements for such functions/subsystems are safety-related.

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 116

Example Safety Function/Subsystem Rqmts₂

“Except when the weapons bay doors are open or have been open within the previous 30 seconds, the weapons bay cooling subsystem shall maintain the temperature of the weapons bay below X° C.”

“The Fire Detection and Suppression Subsystem (FDSS) shall detect smoke above X ppm in the weapons bay within 2 seconds at least 99.9% of the time.”

“The FDSS shall detect temperatures above X° C in the weapons bay within 2 seconds at least 99% of the time.”

“Upon detection of smoke or excess temperature, the FDSS shall begin fire suppression within 1 second at least 99.9% of the time.”

Example Security Function/Subsystem Rqmts

Functions or subsystems strictly added for security:

- Access Control
- Antivirus Subsystem
- Encryption/Decryption
- Firewalls
- Intrusion/Detection Subsystem

All requirements for such functions/subsystems are security-related.

Look in the Common Criteria for many reusable example security function requirements.

Example Security Function/Subsystem Rqmts

“The system shall use encryption/decryption to protect confidential information.”

“The system shall incorporate an intrusion and detection subsystem.”

“The system shall incorporate a virus detection subsystem.”

Safety and Security Constraints

A **Constraint** is any Engineering Decision that has been chosen to be mandated as a Requirement. For example:

- Architecture Constraints
- Design Constraints
- Implementation Constraints
(e.g., coding standards or safe language subset)
- Testing Constraints

A **safety constraint** is any constraint primarily intended to ensure a minimum level of safety (e.g., a mandated safeguard).

A **security constraint** is any constraint primarily intended to ensure a minimum level of security (e.g., a mandated countermeasure).

Safety and Security Standards often mandate Industry Best Practices as Constraints.

Example ZATS Safety Constraints

“When the vehicle is stopped in a station with the doors open for boarding, the horizontal gap between the station platform and the vehicle door threshold shall be no greater than 25 mm (1.0 in.) and the height of the vehicle floor shall be within plus/minus 12 mm (0.5 in.) of the platform height under all normal static load conditions...”

Automated People Mover Standards – Part 2: Vehicles, Propulsion, and Braking (ASCE 21-98)

“Oils and hydraulic fluids shall be *flame retardant*, except as required for *normal lubrication*.”

Note need to define flame retardant and normal lubrication.

 Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 121

Example Security Constraints

“Servers shall be protected by firewalls.”

“Users shall be identified and authenticated by textual user IDs and associated pass phrases.”

“Sensitive data shall be protected by use of a COTS public key encryption/decryption product.”

“Malware infection shall be prevented by the use of a COTS antivirus product.”

Hazard Analysis (Safety)₁

Hazard analysis usually implies the analysis of assets, harm, incidents, hazards, and risks.

Hazard analysis often occurs multiple times before various milestones:

- Preliminary Hazard Analysis (PHA)
- System Hazard Analysis (SHA)

Hazard analysis should probably be performed continuously.

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 137

Hazard Analysis (Safety)₂

Traditional hazard analysis techniques:

- Come from reliability analysis
- Concentrate on failure analysis
- Do not address all safety concerns

Safety and reliability are not the same:

- Unreliable system that is safe (does nothing)
- Safe system that is unreliable (failures do not cause accidents)

Techniques include:

- Event Tree Analysis (ETA)
- Fault Tree Analysis (FTA)
- Hazard Cause and Effect Analysis (HCEA)
- Failure Mode Effects Criticality Analysis (FMECA)

Software Engineering Institute | Carnegie Mellon

Example Hazard, Events, Harm, and Asset

Passenger = valuable asset
Passenger death = harm to asset

Passenger Falls Out (accident trigger)

Passenger Rolls Onto Guideway (accident trigger)

Passenger Touches Power Rail and is Killed (harm event)

Door Unexpectedly Starts Opening (hazardous event)

Taxi Starts Moving (normal event)

Passenger Rolling on Walkway (condition)

Passenger on Guideway (condition)

Door Not Closed (condition)

Taxi is Moving (condition)

Moving Taxi with Door not Closed (hazard)

Time →

Fault Tree Analysis (FTA)

Develop fault trees (deductive, backwards-search, decision trees) to identify *causes of failures*.

Advantages:

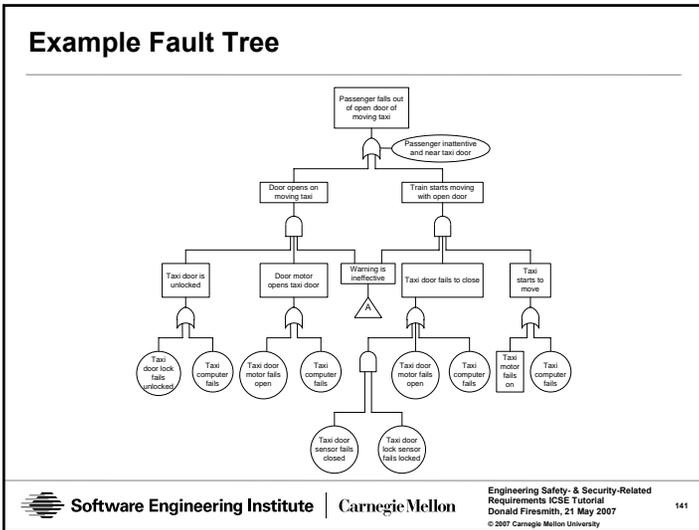

- Long history (1962) of successful use (system/hardware reliability)
- Good documentation
- Well known (in reliability engineering community)
- Good tool support
- Can support quantitative analysis (often impractical for SW)
- Can be used to (indirectly) identify hazards, common causes of safety events, safeguards, and associated requirements

Disadvantages:

- System architecture needed
- Only events, not states (e.g., hazards)
- Non-intuitive symbology that is inconsistent with event trees
- Very expensive and time consuming to produce
- Requires significant analyst expertise
- Ignores system mode

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 140

Event Tree Analysis (ETA)

Develop Event Trees (inductive, forwards-search, decision trees) to identify *consequences of failures*.

Advantages:

- Long history (1962) of successful use (system/hardware reliability)
- Good documentation
- Well known (in reliability engineering community)
- Good tool support
- Can be used to (indirectly) identify safety events, accidents, and associated requirements

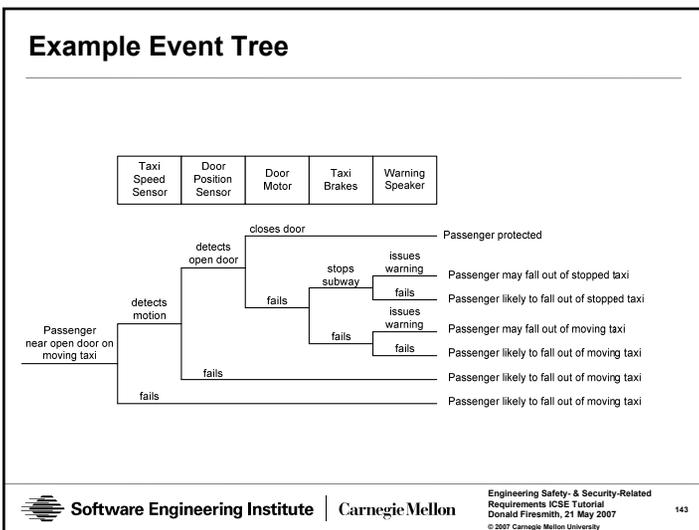

Disadvantages:

- System architecture needed
- Only events, not states (e.g., hazards)
- Non-intuitive symbology that is inconsistent with fault trees
- Very expensive and time consuming to produce
- Not all failures lead to safety events, accidents, and incidents
- Ignores system mode

Software Engineering Institute | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University

142

Hazard Cause and Effect Analysis (HCEA)

Develop cause/effect graphs (deductive and inductive, backwards and forwards search, decision trees) to identify *causes and consequences of safety events and conditions*.

Advantages:

- Designed for Safety Analysis
- Emphasize both Events and States (hazards)
- Use single, compatible notation
- Identifies safety events, accidents, incidents, safety conditions, and associated requirements

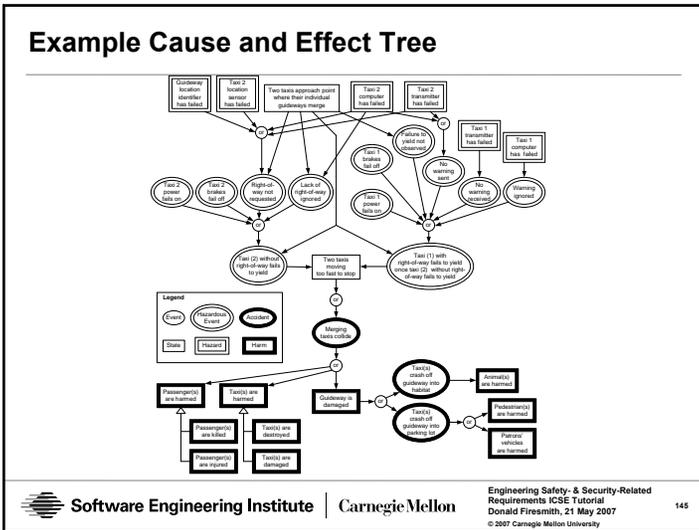

Disadvantages:

- Short history
- Not much documentation
- Not well known
- No tool support
- Very expensive and time consuming to produce
- Ignores system modes

Comparison of Graphical Techniques

Comparison of Techniques	Event Tree Analysis (ETA)	Fault Tree Analysis (FTA)	Hazard Cause Effect Analysis (HCEA)
Analysis Type	Inductive Analysis	Deductive Analysis	Inductive and Deductive Analysis
Graph Type	Event Trees	Fault Trees	Cause and Effect Graphs
Search Direction	Forwards Search	Backwards Search	Forwards and Backwards Search
Scope	Cause of Failure Events (Causes of Accidents)	Effects of Failure Events (Effects of Hazards)	Causes and Effects of Safety Events and Conditions
Use	Identify Hazards	Identify Accidents	Identify Hazards, Accidents, and Incidents
Domain	Reliability (Safety) Analysis	Reliability (Safety) Analysis	Safety Analysis

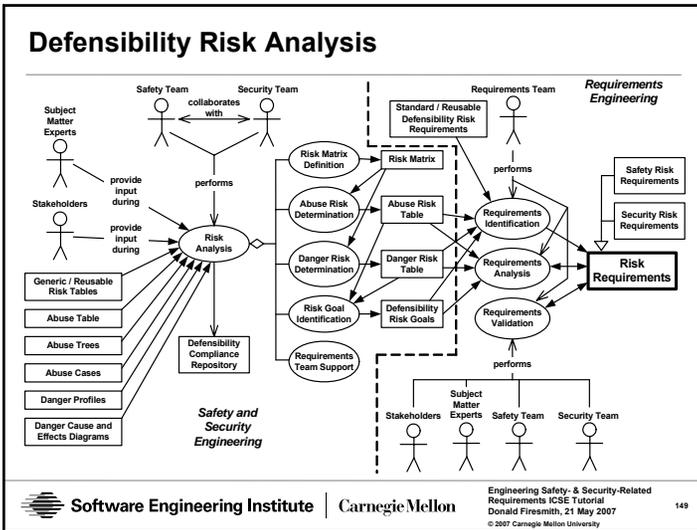

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University

- ### Failure Modes Effects Criticality Analysis (FMECA)
- FMECA stores relevant information in tabular form:
- Architecture component that can fail
 - Failure Mode (of component)
 - Failure Cause
 - Possible Effects of failure
 - Effect Severity (i.e., harm severity)
 - Failure Probability
 - Criticality (risk)
 - Controls (reliability/safeguards)
- Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University

Example FMECA Table

Component that fail	Failure Mode	Failure Cause	Failure Effect	Failure Severity	Failure Likelihood	Criticality (Risk)	Safety Controls
Accelerometer (Taxi sensor)	No data, Bad data (0, last value, maximum value)	Hardware failure, loss of electrical power, wiring fails	Excessive acceleration or deceleration causing passenger injury	Minor	Low	Moderate	Hardware redundancy, High-reliability COTS component, SW fault tolerance
Computer Hardware (Taxi)	Loss of function (complete or intermittent), bad data	CPU, electrical power (loss or spike), hard drive, motherboard, or RAM failure, high temperature	Taxi not controllable (e.g., braking, power, steering), collision between taxis, collision with guideway, unexpected or emergency braking	Severe	Moderate	Critical	Hardware redundancy, High-reliability COTS components, temperature sensor, SW fault tolerance
Computer Software (Taxi)	Loss of function (complete or intermittent), incorrect function, bad timing of function	CPU, electrical power (loss or spike), hard drive, motherboard, or RAM failure, high temperature	Taxi not controllable (e.g., braking, power, steering), collision between taxis, collision with guideway, unexpected or emergency braking	Severe	High	Critical	SEAL 1 applied (e.g., SW fault tolerance, real-time operating system, safe language subset, formal specification of core functions, etc.)

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University

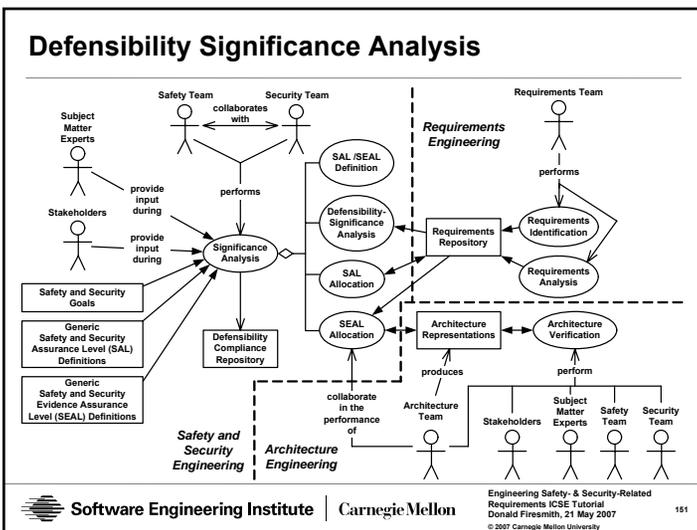

Example Safety Risk Matrix

Safety Risk Matrix defines safety risk (and SAL) as a function of:

- Harm severity
- Accident/hazard frequency of occurrence.

Safety Risks / Safety Assurance Levels (SALs)					
Harm Severity	Frequency of Accident / Hazard Occurrence				
	Frequent	Probable	Occasional	Remote	Implausible
Catastrophic	Intolerable	Intolerable	Intolerable	Undesirable	ALARP
Critical	Intolerable	Intolerable	Undesirable	ALARP	ALARP
Major	Undesirable	Undesirable	ALARP	ALARP	Acceptable
Minor	Undesirable	ALARP	ALARP	Acceptable	Acceptable
Negligible	ALARP	ALARP	ALARP	Acceptable	Acceptable

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University 150

Safety/Security Assurance Levels (SALs)

Safety/Security Assurance Levels (SALs) are categories of requirements based on their associated safety/security risk level.

SALs can be determined for:

- Individual requirements.
- Groups of related requirements (e.g., features or functions).

SALs should be appropriately, clearly, and unambiguously defined.

Software Engineering Institute | Carnegie Mellon
 Engineering Safety- & Security-Related Requirements ICSE Tutorial
 Donald Firesmith, 21 May 2007
 © 2007 Carnegie Mellon University 152

Another Example of Safety/Security Assurance Levels (SALs)

Intolerable:

The risk associated with the requirement(s) is totally unacceptable to the major stakeholders. The requirement(s) *must* therefore be deleted or modified to lower the associated risk.

Undesirable:

The risk associated with the requirement(s) is so high that major (e.g., architecture, design, implementation, and testing) steps should be taken to lower the risk (e.g., risk mitigation and risk transfer) to lower the risk.

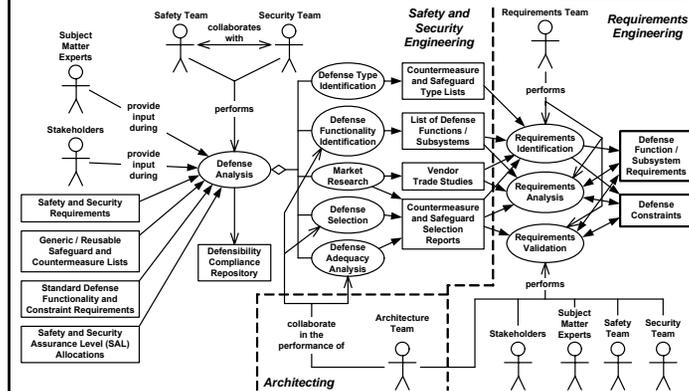

As Low As Reasonably Practical (ALARP):

Reasonable practical steps should be taken to lower the risk associated with the requirement(s).

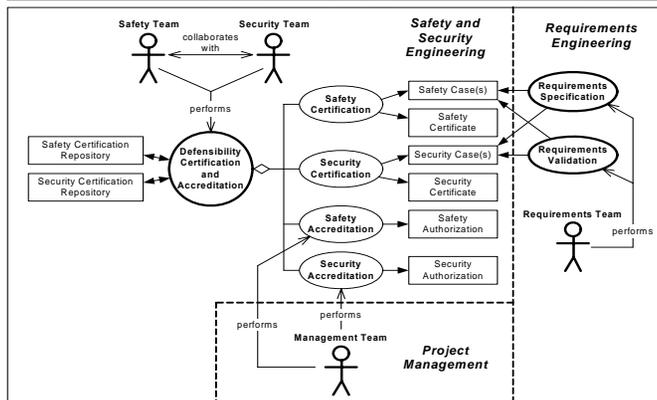

Acceptable:

The risk associated with the requirement(s) is acceptable to the major stakeholders and no additional effort must be taken to lower it.

Defense Analysis

Defense Certification and Accreditation

Conclusion:

Process Improvement Recommendations

Conclusion ◀

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 157

Conclusion₁

Engineering safety-significant requirements requires *appropriate*:

- Concepts
- Methods
- Techniques
- Tools
- Expertise

These must come from:

- Requirements Engineering (Safety- and Security-related Requirements)
- Safety Engineering (Analysis and Safety Goals)
- Security Engineering (Analysis and Security Goals)

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 158

Conclusion₂

There are four types of Safety- and Security-related Requirements:

- Safety and Security Quality Requirements
- Safety- and Security-Significant Requirements
- Safety and Security Function/Subsystem Requirements
- Safety and Security Constraints

Different Types of Safety- and Security-related Requirements have different Structures.

These different Types of Requirements need to be identified, analyzed, and specified differently.

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 159

Conclusion₃

Processes for Requirements Engineering, Safety Engineering, and Security Engineering need to be:

- Properly interwoven.
- Consistent with each other.
- Performed collaboratively and in parallel (i.e., overlapping in time).

 **Software Engineering Institute** | Carnegie Mellon

Engineering Safety- & Security-Related Requirements ICSE Tutorial
Donald Firesmith, 21 May 2007
© 2007 Carnegie Mellon University 160

Process Improvement Recommendations

Ensure close Collaboration among Safety, Security, and Requirements Teams.

Better Integrate Safety and Security Processes:

- Concepts and Terminology
- Techniques and Work Products
- Provide Cross Training

Better Integrate Safety and Security Processes with Requirements Process:

- Early during Development Cycle
- Clearly define Team Responsibilities
- Provide Cross Training

Develop all types of Safety- and Security-related Requirements.

Ensure that these Requirements have the proper Properties.

Final Thoughts

Look for my upcoming book by the same title to be published by Auerbach.

The slides for this tutorial will be put onto the SEI Website in the next 2 weeks, probably on the ASP Publications webpage:

www.sei.cmu.edu/programs/acquisition-support/presentations.html
